

MILESTONE 06 / DELIVERY RECORD

Approved repair

Implemented; live execution pending

Exact-plan approval, digest-checked scoped patches, true source diff and mandatory final verification.

What was built

Exact-plan approval, digest-checked scoped patches, true source diff and mandatory final verification.

Debugging and evidence

4 source-tool tests and mocked repair flow test approved edits, rejected scope, stale approvals and late cancellation.

Remaining limitations

No real container/Groq repair observed. Reserved branch is materialized remotely only after publication approval.

Scope of this document

The following pages list the 2 source, configuration, test and documentation files assigned to this stage, with their purpose. Shared files are assigned to their principal delivery stage; the complete guide lists every authored file. Generated dependencies, caches, private settings and saved repository data are excluded.

Owner workflow

All development stages were authorized together. In-product approval is still required before repairs and again before publishing. No remote GitHub changes were made during development verification.

Folder structure

```
backend/  
  src/  
    main/  
      java/  
        dev/  
          codebasedoctor/  
            agent/  
              SourceTools.java  
    test/  
      java/  
        dev/  
          codebasedoctor/  
            agent/  
              SourceToolsTest.java
```

Files and responsibilities

`backend/src/main/java/dev/codebasedoctor/agent/SourceTools.java`

Created | Delivery stage 6

Reads snapshot files, applies approved digest-checked exact patches and creates true changed-file records and full-file unified diffs.

`backend/src/test/java/dev/codebasedoctor/agent/SourceToolsTest.java`

Created | Delivery stage 6

Checks patch approval/digests, creations/deletions, actual diffs, stale publication review and provider response shape.
