

MILESTONE 08 / DELIVERY RECORD

GitHub publication

Implemented; live publication pending

Reviewed digest, saved-source consistency, default-head check, new doctor branch and optional draft PR.

What was built

Reviewed digest, saved-source consistency, default-head check, new doctor branch and optional draft PR.

Debugging and evidence

4 mocked GitHub tests verify branch/PR behavior, idempotent completed retry and rejection of stale/tampered/colliding state.

Remaining limitations

No remote objects were created. Real token permissions and external API behavior require authorized runtime validation.

Scope of this document

The following pages list the 2 source, configuration, test and documentation files assigned to this stage, with their purpose. Shared files are assigned to their principal delivery stage; the complete guide lists every authored file. Generated dependencies, caches, private settings and saved repository data are excluded.

Owner workflow

All development stages were authorized together. In-product approval is still required before repairs and again before publishing. No remote GitHub changes were made during development verification.

Folder structure

```
backend/  
  src/  
    main/  
      java/  
        dev/  
          codebasedoctor/  
            github/  
              GitHubPublisher.java  
    test/  
      java/  
        dev/  
          codebasedoctor/  
            github/  
              GitHubPublisherTest.java
```

Files and responsibilities

`backend/src/main/java/dev/codebasedoctor/github/GitHubPublisher.java`

Created | Delivery stage 8

Validates publication approval/source integrity, creates new Git objects and doctor references, and optionally creates an approved draft PR.

`backend/src/test/java/dev/codebasedoctor/github/GitHubPublisherTest.java`

Created | Delivery stage 8

Four mocked HTTP tests verify new doctor branches/draft payloads, retry behavior, stale or tampered state and branch collision rejection.
